
image effects fireworks Recreating a look

Posted by paulkirtley - 2008/06/30 10:45

RE: http://jawbone.com/press_newspress.aspx Look at this link. I'm trying to recreate the shadowbox effect shown at this link. The central white triangular space receives the shadow of the black foreground. Does anyone have any idea how this effect can be recreated using Dreamweaver/Fireworks? I welcome any discussion on this. thanks

I don't think I'd emulate that construction method. A 4000px tall background image?

Here's how you could do it in Photoshop. Probably very similar to FW. After creating the image, I would slice it into a minimum of 3 small sections (top, bottom & a small slice for the middle which would repeat down the page). <http://alt-web.com/Photoshop-Background.html>

I don't think the bottom slice is needed, at least if OP wants an exact duplicate of the look he referenced.

Ummm ok. Just Top and Middle slices.

ok...I'll go to work on the latter suggestion. Not sure exactly how it will look in Photoshop until I try it. I'll be back. Thanks everyone!

ok...I followed the Photoshop tutorial, and I think I've got that down, but I'm not sure how I can apply text in Dreamweaver on top of the artwork. Is it possible to assign the art as a background, then with a transparent layer, enter type on top of it? Thanks

I didn't mean to correct you, just simplify the task for the OP. :-)
